TITLE: The influence of titanium dioxide on the electrical conductivity of slag

SOURCE: Akademiya nauk SSSR. Institut metallurgii. Titan i yego splavy. No. 4. Moscow, 1960. Metallurgiya titana, 24-27

TEXT: Since titanium dioxide and titanium tetrachloride were obtained by high-temperature electrolytic reduction of ilmenite concentrate melts, it is important to know the effect of slag constituents on electrical conductivity in order to avoid a dissipation of electrical energy instead of its conversion into heat. As a first step the influence of TiO_2 was selected for investigation. The method was based on measuring the out-of-balance current in a 4-arm bridge circuit with the furnace-enclosed electrolytic cell and a variable resistance constituting one arm and fixed resistances the other three. The bridge was initially

Card 1/3

The influence of titanium dioxide on the D215/D302
...

balanced at a certain resistance value close to that expected, so that when unbalance arose current was fed across the bridge diagonal, proportionally to the deviation. This was recorded by a d.c. microammeter of the M 95 (M95) type, included in the diagonal together with a rectifier. Calibration was effected by using standard resistances in place of the cell; the limits of accuracy were 0.0001 ohm. Current supply was from a.c. mains at normal frequency. The measuring cell consisted on a eccentrically bored molybdenum crucible of 24 mm internal diameter forming one electrode, and a 3 mm diameter rod electrode which was immersed in the slag to a depth of 10 mm.. The cell constant was determined using a standard 0.1N KCl solution, the circuit resistance by shorting the electrodes. Synthetic slags based on $TiO_2-SiO_2-Al_2O_3-FeO-MgO$ with Al_2O_3 and MgO constant at 2% each and $FeO/SiO_2 = 0.6$ were investigated.

These were made from chemically pure oxides, carefully mixed and briquetted. The furnace was of the Tamman type and the atmosphere oxygen-free nitrogen. The results are shown graphically. The anomalously

high conductivity of high-titanate slags in comparison with silicates and the weak temperature dependence and high conductivity even in the solid state suggested that titanium dioxide conferred both ionic and electronic conductivity. There are 2 figures and 1 table.

TITLE: Electric conductivity of melts of the ferrous oxide-titanium dioxide system

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 2, 1962, 11-12, abstract 2A55 ("Izv. AN SSSR, Otd. tekhn. n.", 1961, no. 4, 24-28)

TEXT: Electric conductivity of slags was measured by the method of a non-equilibrium bridge at up to 1,900°C. The samples were prepared by mixing and briquetting of chemically pure components. After completed experiments samples were pumped-off for mineralogical and X-ray analyses. It was established that Ti-oxides have high (for oxides) electronic conductivity. Bends corresponding to ferrous ortho- and metatitanate, were observed on isotherms showing changes in the electric conductivity of slags in the FeO-TiO₂ system. The high electronic conductivity of Ti-dioxide under weakly reducing conditions is apparently caused by the appearance of defects in the rutile lattice on account of the partial oxygen loss. The high electronic conductivity of the slags investigated in the FeO-TiO₂-Ti₂O₃ system, leads to the assumption that the solid solutions

Card 1/2

on Ti_3O_5 and Ti_2O_3 lattice base (anosovite and tagirovite) possess also high conductivity. These minerals are the basic phases of industrial titanium slags and assure their high conductivity.

TITLE: Electric conductivity of titanium slags

PERIODICAL: Referativnyj zhurnal, Metallurgiya, no. 7, 1962, 10, abstract 7A54
(In collection: "Titan i yego splavy". Moscow, AN SSSR, no. 5,
1961, 95 - 101).

TEXT: Electric conductivity χ of high-titanium slags (80 - 90% TiO_2) is reduced 2 - 3 times by adding limestone or dolomite to the charge with the purpose of obtaining slag with 4 - 6% CaO which creates conditions for a smoother electro-smelting process. A further increase of fluxing components in the slag, although it secures more favorable conditions for smelting concentrates, makes the slag considerably poorer in respect of TiO_2 and deteriorates its quality. The presence of FeO in slag has no considerable effect on its χ . A further increase of FeO up to 15% causes a gradual decrease of χ owing to TiO_2 impoverishment of slag, which is a decisive factor affecting χ of slag. Contrary to notions that existed previously, it has been established that an increase of the degree of overreduc-

Card 1/2

Electric conductivity of titanium slags

S/137/62/000/007/004/072
A052/A101

tion of Ti_2O_3/TiO_2 slag from 0 to 0.8 changes its χ insignificantly. A decrease of the resistance of the smelt at the end of the electrosmelting and the change of the furnace to the arc process are connected obviously with a higher Ti concentration in slag and not with the emergence of lower Ti oxides. As an explanation of unusually high χ for slags, which TiO_2 imparts to them, the assumption can be made that at smelting in a reducing atmosphere TiO_2 , like FeO and MnO , has an electronic conduction.

TITLE: Electrochemical separation of titanium-aluminum
alloys

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Otdeleniye
tekhnicheskikh nauk. Metallurgiya i toplivo,
no. 2, 1962, 49-55

TEXT: In order to study the possibility of separating Ti
and Al by means of electrolytic refining, the authors measured
the potentials of Ti and Al electrodes, functioning both as
cathodes and anodes. NaCl was fused in a graphite crucible
placed in a stainless steel sleeve, and the electrodes were
immersed in it. One electrode was of steel, and was lowered
directly into the melt, while the other, upon which measurements
were made, was enclosed in a quartz test tube to effect maximum
separation between the electrolyte in its vicinity and the body
of the melt. The test tube had an opening of 2 mm diameter for
the passage of current. The Ti electrode consisted of a

Card 1/4

Electrochemical separation of ...

S/180/62/000/002/003/018
E091/E135

cylinder, 6 x 50 mm. It was attached to a steel wire and lowered into the melt to a depth of 10 mm below the surface. The Al electrode consisted of a graphite rod suspended in a quartz test tube of 16 mm diameter, containing molten aluminium. The working surface of each of the electrodes was 2 cm^2 . Prior to measuring the potentials, the electrode under investigation was anodically polarised for a period of time necessary to ensure the required Ti or Al ion concentration in the melt of the cell. These concentrations were checked before each test by means of calorimetric analysis. Electrode potentials were first measured under conditions of anodic polarisation, with current densities varying from 0 to 1 A/cm^2 and down to zero again. The behaviour during cathode polarisation was subsequently investigated in a similar manner. Each cycle of measurements lasted approximately 5 minutes. For the measurement of electrode potentials, a silver reference electrode was used. To maintain electrical contact between the electrolytes in the cells investigated and the reference electrode, without allowing them to mix, the latter was jackotted

Card 2/4

Electrochemical separation of ...

S/180/62/000/002/003/018
E091/E135

by two test tubes possessing openings of 1 mm diameter covered with asbestos diaphragms. The outermost of these was made of graphite, in order to protect the inner quartz tube from attack by metallic sodium which was evolved at the cathode, and also to create an additional obstacle to the mixing of the electrolytes. Thus the authors measured the e.m.f. of the cell Ag^+/NaCl , $\text{AgCl} (5\%)/\text{NaCl}/\text{NaCl}$, $\text{MgCl}_x/\text{Mg}^-$ at 870 °C, under conditions both of electrolysis with various current densities, and without polarising action (i.e. under conditions approaching those of equilibrium). A low frequency electron oscillograph was used as the measuring instrument. The solubility of AlCl_3 in molten chlorides was studied by an electrolytic method, using the same apparatus as that used for the determination of potentials but without reference electrode. Aluminium, placed at the bottom of a double-walled quartz test tube, was anodically dissolved in the molten salt, using a current of 2 A. Molten lead was used as the cathode. The current was supplied through graphite rods.

The anode and cathode compartments communicated through an opening of 3 mm diameter made in the walls of the test tubes.

Card 3/4

Electrochemical separation of ...

S/180/62/000/002/003/018
E091/E135

Argon was passed into the test tube containing the Al' in order to provide an inert atmosphere and to remove AlCl_3 vapours. After definite periods of time, samples of the electrolyte were withdrawn for determination of their Al content. Synthetic alloys were used for the study of the separation of Ti and Al. Melting was carried out in an arc furnace with a tungsten electrode, in an atmosphere of argon at 0.5 atmospheres pressure. Binary alloys, containing between 5 and 60% Al at intervals of 5%, were electrolytically refined. Electrolysis was carried out at 670°C , using a current of 8 A (cathode C.D. = 1.3 A/cm^2 , anode C.D. = 0.1 A/cm^2) for one hour. It was found that Ti and Al cannot be effectively separated by means of electrolytic refining in molten sodium chloride baths. However, the solubility of AlCl_3 in chlorides which do not form complex compounds with it is only a few hundredths of 1%, and experience with the refining of Ti-Al alloys has shown that electrolytic separation of these metals can be based on the low solubility of AlCl_3 in a melt of CaCl_2 . There are 3 figures and 4 tables.

AUTHOR: Balikhin, V. S.

TITLE: Second conference on physical chemistry and electrochemistry of fused salts and slags

SOURCE: AN SSSR. Izv. Metallurgiya i gornoye delo, no. 1, 1964, 191-192

TOPIC TAGS: physical chemistry, electrochemistry, electrolysis, salt, electrolyte, ionic melt, slag

ABSTRACT: The Second Conference on physical chemistry and electrochemistry of molten salts and slags took place in Kiev, October 15-18, 1963. It was organized by the Institut obshchey i neorganicheskoy khimii AV USSR (Institute of General and Inorganic Chemistry, AN Ukrainian SSR). Over 100 papers were presented on electrochemical kinetics, physicochemical properties of fused salts, slags, and electrolysis. At the plenary session the speakers included A. I. Balyayev, "An experimental study of P. P. Fedot'yev and V. P. Il'inskiy on the electrometallurgy of aluminum," Yu. K. Delimarskiy on "The kinetics of electrode processes and the

Card 1/3

ACCESSION NR: AP4019821

polarography of thermodynamics in ionic melts," B. F. Markov, on "The structure and physicochemical properties of ionic melts of salts," Yu. V. Baymakov on "The crystallization of metals on the cathode," and N. K. Voskresenskaya on "The thermodynamic basis of the Kablukov Law." The attention of the Conference was directed along two lines: 1) the study of the nature of ionic melts; 2) investigations dealing with the electrode processes in fused salts. A report of E. A. Ukshe and N. G. Bukan dealt with "An investigation of the structure of molten salts by the method of physical modeling." Their models were wooden disks floating on water, representing the ions and approximating the distribution of sodium and potassium chloride. B. F. Markov and V. D. Prisyazhny reported on "Physico-chemical characteristics of certain mutually soluble fused salts." I. N. Sheyko and V. T. Barchuk submitted a paper on "The behavior of zirconium dichloride in molten salts," showing that above 550°C zirconium dichloride yields zirconium tetrachloride and metallic zirconium. Yu. V. Baymakov presented a report on electrocrystallization of silver from fused electrolytes, and A. N. Baraboshkin reported on the electrocrystallization of copper. N. T. Krasil'nikov discussed new investigations in the field of anode and cathode processes in his paper on "Electrode processes in electrolysis of niobium," while O. V. Skiba reported on "Electrode processes in chloride fusions containing uranium." The next conference will

1935. THERMOCHEMISTRY AND PHYSICO-CHEMICAL PROPERTIES

Action of gaseous chlorine on sulfides, oxides and sulfates of lead, zinc, copper, silver and iron in relation to temperature. D. M. Chizhikov and G. S. Balikhina, *Tsvetnaya Metal.* 1935, No. 4, 59-77; cf. *C. A.* 30, 11881. The effect of gaseous Cl₂ on PbS, ZnS, Cu₂S, Ag₂S, Fe₂S, PbO, ZnO, CuO, PbSO₄, ZnSO₄ and CuSO₄ was studied at temps. from 100° to 800°. Raptl. technic is described in detail, and numerous quantitative data are given. Conclusions: The sulfides are the most easily converted into chlorides and the sulfates the least. The chlorination of sulfides and oxides is easily completed at temps. up to 700°, while the chlorination of sulfates below this temp. proceeds only very slowly. As a rule the chlorination of sulfides begins at lower temps. than that of oxides and sulfates. With increasing temps. the velocities of chlorination of sulfides and oxides tend to equalize.

BALIKHINA, G.S.

Chlorination of tin concentrates. D. M. Chizhikov and G. S. Balikhina. Fiziko-Metal. No. 8, 68-75 (1967).—The authors' expts. showed that Sn can be re-

covered from ore by chlorination, and the following advantages of this method are claimed: (1) Concentrates as low in Sn as 25-30% can be treated while pyrometallurgical processes require 50 to 60% Sn concentrates. This means that the use of this process will result in increased recovery of Sn from ore, because the losses in tailings are the higher the richer the concentrate. (2) Metal free from impurities can be obtained whereas in pyrometallurgical processes the tin is contaminated by other metallic elements and requires further refining operations. The authors experimented with chlorination of oxides and sulfides of Sn, Pb, Zn, Cu, Fe, Ag and As at temps. from 150° to 700°. These metals, with the exception of Fe, are converted into chlorides at 700° to the extent of 70 to 100%, while Sn₂O₃ is little affected. At 700° the chlorides Zn and As volatilize, and the chlorides of Pb, Fe, Cu and Ag can be easily leached out. Natural SnO₂ (cassiterite) does not react with Cl. However, in presence of C, CO, or oxides of Fe, chlorination takes place. Samples of cassiterite contg. 97.4% SnO₂ and 1.79% Fe₂O₃ were chlorinated for 2 hrs. in the presence of C and (or) CO at 400°, 600° and 800°. At 800° in presence of CO, 10.5% of Sn was converted into chloride, and in presence of solid C, 73%. When both C and CO were present 84% of the Sn was chlorinated. With Fe₂O₃ present (in the ratio of 1 part Fe to 3 parts Sn) 5.8% Sn was chlorinated at 800°. The chlorination is still further favored by simultaneous presence of C and Fe₂O₃, or CO and Fe₂O₃, whereby over 100% of Sn is chlorinated. Further expts. on semicom scale are contemplated.

Poperechno-vintovaya prokatka kuznechnykh zagotovok (Helical Cross Rolling of Forged Blanks) Moscow, Mashgiz, 1959. 74 p. 2,500 copies printed.

Ed.: G. M. Makovskiy, Engineer; Ed. of Publishing House: L. A. Osipova; Tech. Ed.: G. V. Smirnova; Managing Ed. for Literature on Heavy Machine Building (Mashgiz): S. Ya. Golovin, Engineer.

PURPOSE: This book is intended for technical personnel in forging and rolling shops and for engineers interested in the use of shaped blanks in forging. General readers interested in developments in this field may find the booklet useful.

COVERAGE: The author presents the results of experiments in helical cross rolling of periodic profile stock and its use in forging. Following the description of helical cross rolling an explanation is given of the design features of mills and roll design for special periodic profiles. It is stated that Soviet engineers are

TITLE: Rolling by wedges

PERIODICAL: Kuznechno-shtampovochnoye proizvodstvo, no. 6, 1962, 12-16

TEXT: General data is given on a rolling method first used in 1947 for preparing forging blanks of automobile engine connecting rods and now employed by Soviet plants for producing balls, rings, bushings, scraper conveyer shafts, etc. The method is called "cross or helical cross rolling", and consists in passing stock through a pair of rolls with wedge-shaped protrusions placed in a straight or in a helical line (Fig. 1 and 4). The output of a rolling mill with 500 mm diam. rolls, working with 3 electric heaters, is 3,000 billets per shift and may be higher when using more productive heating equipment. One latest mill design uses a roll and a concave segment instead of a pair of rolls. Experiments were conducted with two 400 mm diam. rolls mounted in a specially designed attachment to a hydraulic press. In this case, called open rolling, the wedges and spacing inserts between them are attached to the rolls by screws

Card 1/8

Rolling by wedges

S/182/62/000/006/003/004
D040/D113

and may be exchanged and used in various combinations for different work. The force equations in open and closed rolling are included. Wedge rolling of forging blanks is economical because of (a) the very low waste of metal that has to be cut off from blanks rolled in strings, and (b) the very high wear resistance of wedge rolls in comparison to dies, high productivity of rolling, and automation of the rolling process. It has quickly replaced other methods of producing large balls in the ball bearing and cement industries. There are 7 figures.

No. 172305

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 13, 1965, 16

TOPIC TAGS: monomer, alkyl vinyl terephthalate, aryl vinyl terephthalate

ABSTRACT: An Author Certificate has been issued for a preparative method for alkyl or aryl vinyl terephthalates involving the reaction of terephthaloyl chloride alkyl or aryl half ester with vinylating compounds. To widen the range of monomers suitable for preparing polymers having different physicomechanical properties, the vinylating component used is chloromercuric ethylate or mercuribisacetaldehyde (sic).

TEXT: Terephthalic esters of the general formulas $XCH_2CH_2COOCC_6H_4COOCH_2CH_2X'$ (where X = Cl, Br, I, CNS, CN, ONO_2 , OCH_3 , OC_2H_5 , and X' = Cl, Br, I, F, CNS, CN, ONO_2 , OCH_3 , OC_2H_5) and $H_3COOCC_6H_4COOCH_2CH_2X$ (where X = Cl, Br, I, F) were synthesized to study the possibilities of the polycondensation of various β,β' -disubstituted diethyl terephthalates. The polycondensation of the terephthalic esters was conducted in the presence of $ZnCl_2$, $Zn(CH_3COO)_2$, Sb_2O_3 , and Li_2CO_3 . Polymers of methyl- β -chloroethyl terephthalate, of β,β' -dichloro-diethyl terephthalate, and of β,β' -dibromo-diethyl terephthalate were obtained. The esters synthesized, the

TITLE:

The Effect of Ultraviolet Irradiation and Temperature on Luminescence
of CdI₂-MnCl₂ and CdI₂-MnCl₂-PbI₂ Phosphors (Vliyaniye ul'trafioletovogo
oblucheniya i temperatury na lyuminestsentsiyu fosforov CdI₂-MnCl₂,
CdI₂-MnCl₂-PbI₂)

PERIODICAL: Optika i spektroskopiya, 1959, Vol 6, Nr 6, pp 760-763 (USSR)

ABSTRACT: The author found earlier (Ref 1) that CdI₂-MnCl₂ phosphor becomes darker after irradiation with 365 m μ . This darkening was accompanied by a weakening of luminescence proportional to the duration of ultraviolet irradiation. The present paper describes studies of the effects of ultraviolet irradiation and of temperature (acting separately and together) on the 675 m μ red luminescent band of CdI₂ phosphors activated with MnCl₂ and MnCl₂+PbI₂. After one hour of ultraviolet irradiation at 20°C the red emission fell considerably (Fig 1 curve 1) but it was partly re-established after 44 hours in darkness. Further irradiation (after these 44 hours) produced a similar effect, as shown by curve 2 in Fig 1. This decrease of the red emission intensity was always hyperbolic (Fig 2). The author studied the effect of ultraviolet irradiation on the following phosphors: CdI₂+1%MnCl₂, CdI₂+10%MnCl₂, CdI₂+20%MnCl₂,

Card 1/3

SOV/51-6-6/34

The Effect of Ultraviolet Irradiation and Temperature on Luminescence of $\text{CdI}_2\text{-MnCl}_2$ and $\text{CdI}_2\text{-MnCl}_2\text{-PbI}_2$ Phosphors

$\text{CdI}_2+50\%\text{MnCl}_2$, $\text{CdI}_2+3\%\text{MnCl}_2+3\%\text{PbI}_2$, $\text{CdI}_2+3\%\text{PbI}_2$. For five of them the results are shown in Fig 3. It was found that with increase of the MnCl_2 content from 1 to 10% (curves 1-3, Fig 3) the effect of ultraviolet radiation became smaller. To explain this effect the author assumes that the red emission of $\text{CdI}_2\text{-MnCl}_2$ is due to Mn and ultraviolet radiation destroys manganese emission centres. The fact that phosphors with larger amounts of MnCl_2 are less affected by ultraviolet radiation may be related to thermal motion and presence of a sufficient number of manganese ions which rapidly reform luminescent centres continuously destroyed by ultraviolet radiation. This was confirmed by studies of the temperature dependence of luminescence quenching by ultraviolet radiation (Fig 4). This figure shows that on increase of temperature the effect of ultraviolet radiation becomes smaller and practically disappears at 100°C . At this temperature practically no darkening of the phosphor can be produced by ultraviolet radiation. At still higher temperatures ($150\text{-}250^\circ\text{C}$) the effect

Card 2/3

1

SOV/51-6-6-6/34

The Effect of Ultraviolet Irradiation and Temperature on Luminescence of $\text{CdI}_2\text{-MnCl}_2$ and $\text{CdI}_2\text{-MnCl}_2\text{-PbI}_2$ Phosphors

of ultraviolet radiation reappears together with temperature quenching (see below). The author studied also the temperature dependence of the intensity of luminescence $\text{CdI}_2\text{-MnCl}_2$ phosphors. At low temperatures the red emission disappears completely but it increases with rise of temperature up to about 60°C and then falls again rapidly (at 300°C the red emission intensity is eleven times smaller than at 60°C). Such temperature dependence of emission was found in CdI_2 phosphors with 3, 10 and 50% of MnCl_2 (curve 1, 2 and 3 in Fig 5). In all these phosphors an almost linear fall of intensity with temperature is observed between 60 and $100\text{-}150^\circ\text{C}$. At higher temperatures this fall follows a more complex curve (Fig 5). The exponential rate of fall with temperature is observed only at temperatures between 100 and 250°C . There are 5 figures and 2 Soviet references.

SOV/2666

USSR. Ministerstvo svyazi. Tekhnicheskoye upravleniye

Elektronnaya fototelegrafiya; informatsionnyy sbornik (Electronic Facsimile Systems; Information Handbook) Moscow, Svyaz'izdat, 1958. 132 p. (Series: Tekhnika svyazi) 9,000 copies printed.

Resp. Ed.: B. Z. Kisel'gof; Ed.: L. S. Salitan; Tech. Ed.: K. G. Markoch.

PURPOSE: This collection of articles is intended for specialists in facsimile systems.

COVERAGE: This collection summarizes information on Soviet and non-Soviet developments in electronic facsimile systems and equipment. Results of investigations in this field at the laboratory of the NIITS (Scientific Research Institute of City and Rural Telephone Service) are presented. These investigations were connected with a project for the adaptation of regular telephone channels, wideband channels and direct communication links for facsimile transmission in place of the previously used special facsimile transmission channels.

Card 1/7

Electronic Facsimile Systems (Cont.)

SOV/2666

The necessity of replacing drum scanning by planar and of introducing several improvements in the transmitting and receiving equipment led to intensified research in this field. Thus emerged the idea of using cathode-ray tubes in those systems similar to the ones used in television. References follow each article.

TABLE OF CONTENTS:

Foreword

3

Yurchenko, V. P. Problems in Electronic Facsimile Systems
The author describes the principles in the design of analyzing and synthesizing devices and enumerates the requirements of cathode-ray tubes and special features of their performance for facsimile systems. The problems of designing picture elements, the recording system and methods of securing stability of operation are also described. The author reveals some deficiencies of separate technical solutions, studies methods for improving them and discusses some theoretical problems in the development of a facsimile system. He also presents a brief history of the problem with some details on

6

Card 2/7

Electronic Facsimile Systems (Cont.)

sov/2666

Soviet accomplishments since 1950. The following mentioned institutions have made contributions in research on electronic scanning: The Leningrad Electrical Engineering Institute of Communications under the direction of P.V. Shmakov, the Leningrad branch of NIITS, the Odessa Electrical Engineering Institute and the Scientific Research Institute of the Ministry of Communications. There are 27 references: 17 Soviet, 7 English and 3 German.

Yurchenko, V. P. The Resolving Power of a Facsimile System With Electronic Scanning. 47

The author presents details of investigations on the resolving power of cathode-ray tubes taking into consideration a required increase in brightness intensity necessary in documentary reproduction of images. Similar data, according to the editors, have been published for the first time and may be of considerable interest to specialists for facsimile, television

Card 3/7

Electronic Facsimile Systems (Cont.)

SOV/2666

and vacuum tube techniques. The author discusses the evaluation of the resolution of a facsimile system which uses experimental cathode-ray tubes of the 18LK9Zh, 18LK9A and other types, and he defines the requirements for the size of the spot on the tube screen. A schematic diagram of the experimental layout is presented and the methods and results of measurements are given. There are 6 Soviet References.

Karpeshko, Yu.Ye. Half-tone Distortions in Facsimile Systems With Electronic Scanning

67

The author examines the half-tone characteristic of the facsimile system. This characteristic is determined by the characteristic of the the analysis and synthesis of half-tones and by the amplitude characteristic of the electric channel. The study of such characteristics for various kinds of analyzing and synthetizing devices is well described in technical literature. However, according to the author, the characteristic of the synthesis of half-tones in facsimile systems with electronic scanning of the image, where the role of light modulator is accomplished by a cathode-ray tube, has not yet been adequately studied. The author investigates the half-tone characteristic of the system, assuming a linear amplitude characteristic of the communication channel. The author compares favorable

Card 4/7

Electronic Facsimile Systems (Cont.)

SOV/2666

experimental results with analytical investigation and presents results in two tables and 4 diagrams. There are 4 Soviet references.

Svetlov, N. I. Methods of Elimination of Perpendicular Streaks in the Half-tone Image Received With the Electronic Single-Scan Line Method

83

The author discusses methods for the elimination of parasitic perpendicular streaks appearing in the half-tone image of the electronic facsimile system. These streaks are caused by the irregular luminescence of the luminophor along the scanning trace, resulting from nonuniformity of the structure or composition of the luminophor and also from defects in the glass of the tube screen. Since the technology of producing luminophores has not been perfected, the author looks for methods for eliminating the parasitic streaks. Among the electromechanical methods, he describes the "Scanning device" submitted by him in 1954, the method of rotating the cathode-ray tube, submitted in 1954 by P. A. Yunakov and the electronic-mechanical vertical sweep method,

Card 5/7

Electronic Facsimile Systems (Cont.)

SOV/2666

submitted in 1954 by V. P. Yurchenko. A method of cylindrical optics was submitted in 1955 by Ye. A. Nikitin and the author (Author's certificate No. 105386). The author presents an example of calculating the quantity of illumination in utilizing cylindrical optics and auxiliary electronic scanning. He concludes that the use of the optical and electromechanical methods brings several improvements. However, some negative characteristics result from these methods, the elimination of which may be affected by using a special tube with a scanning spot. This tube was submitted for an Author's Certificate by V. P. Yurchenko, N. I. Svetlov, and Ye. A. Nikitin on February 18, 1956. The author claims that this tube is satisfactory in operationing conditions and preliminary tests made at the NIITS gave favorable results. In an appendix the author gives the derivation of formulae for the calculation of cylindrical lenses, according to data submitted by V. V. Khvalovskiy. There are 3 Soviet references.

Balin, L. N., L. V. Afanas'yeva. Electrophotographic Method of Obtaining Images

104

The authors describe the newly developed technique of electro-photography, which combines principles of regular photography with the properties of some semiconductor photocells. They note

Card 6/7

Electronic Facsimile Systems (Cont.)

SOV/2666

the deficiencies of this new technique and point out necessary improvements. There are 13 references; 6 Soviet and 7 English. No personalities are mentioned.

Yunakov, P. A. Selection of a Scanning Method for an Electronic Facsimile System

118

The author speaks about the difficulties in affecting strict linearity of scanning in facsimile systems, which is more difficult at facsimile scanning frequencies lower than those used in television. Nonlinear distortions result from various sources. The author describes methods used at the laboratory of the NIITS to affect scanning linearity. Best results were obtained with the following types of cathode-ray tubes of Soviet make: 18LK2B, and two experimental types 18LGZh and 18LK9A, all of which have magnetic focusing and deflection. There are 7 references; 6 Soviet and 1 English. No personalities are mentioned.

TITLE: A New Method of Recording Images in Facsimile Telegraphy
(Novyy sposob zapisi izobrazheniy v fototelegrafii)

PERIODICAL: Vestnik svyazi, 1958, Nr 9, pp 11 - 12 (USSR)

ABSTRACT: The author describes the xerography method of recording images in facsimile telegraphy. This method does away with the need for liquid reagents and makes use of the properties of some photo-semi-conductors. At the receiving end, the reconstituted image is focussed on to the photo-semi-conductor film and produces various surface charges, according to the intensity of the light at any given point. If powder is sprinkled over the film's surface it will be attracted to the charged portions and an image will be reproduced. If the powder is given a charge opposite to that of the film this process will be intensified. The constitution of the powder "developer" is given. For finer reproduction finer powder (soot) must be used. Best results were obtained by coating a metal film with selenium, or paper with zinc oxide. There are two variants of the method: 1) recording onto a metal drum coated

Card 1/2

SOV-111-58-9-9/30

A New Method of Recording Images in Facsimile Telegraphy

with selenium and subsequent transfer of the image onto paper, 2) direct recording on special electro-photographic paper. Details of both methods are given. There are 3 schematic diagrams.

 AUTHOR: Lyalkov, K.S.
 TITLE: Successes of Soviet Electrophotography (Uspishi sovetskoj elektronodostrojki) A Scientific and Technical Conference on Questions of Electrophotography (Electrono-dostrojka) Sverdlovsk konferentsiya po voprosam elektrofotografii.
 PERIODICAL: Zhurnal nauchno-tekhnicheskikh i tekhnicheskikh Sverdlovsk, 1959, vol 4, Izd 2, pp 149-152 (USSR)

ABSTRACT:

This is an account of a scientific and technical conference on electrophotography, the first to be held in the Soviet Union and abroad. It was organized by the Soviet National Economy Ministry on December 15-19, 1958 by the Soviet Narodnoe khozyaystvo Litovskoy SSR (Council for National Economy of the Lithuanian SSR), the Gouudarzov Venyav-Nauchno-tehnicheskii komiteta Sovetskogo Nauchno-tekhnicheskogo i Tekhnicheskogo Committee of Ministers of the Lithuanian SSR) and of the Council of Ministers of the Lithuanian SSR and the Kaunas Research Institute of Electrophotography (Scientific Research Institute of Electrophotography). The conference attended by over 500 scientific workers was opened by the Deputy Chairman of the Council of Ministers of the Lithuanian SSR, Prof. Dr. V. V. Kuznetsov, and V. N. Zhdanovich, the director of the Institute for Electrical Materials. I. I. Zhilovich, reviewed the state of electrophotography in the USSR and prospects for development of electrophotography in this field should be used. He stated that research in this field should be carried out along the following lines: a) a search for new photo-active materials with high dark resistance; b) physical research into the internal photoeffect; c) development of photoconductor layers; d) development of the theory of the electrophotographic process. K. S. Lyalkov (speaking for O.G. Popov) gave a report in which he submitted detailed data on light sensitivity of electrophotographic layers in GOST units. E.Z. Plavinsk (speaking for I.I. Zhilovich) reported on some research on the realization of superdiode) reported on some research on the realization of a semiconductor in electrophotographic layers. Pridin gave a report on highly sensitive electrophotographic layers and an electron photocopying device, and referred the formation process of the latent electro-photographic image on the basis of the zonal theory. He also described the design of an electron-photocopyer for determining sensitivity by the relaxation period of a change on the surface of the layer. Anfilov of an electrophotographic copy-circuite device. Anfilov finished describing the latter and then spoke on the mechanics and kinematics of the development of the latent electrophotographic image in liquid developer.

Card 3/0

207774-2-15/18

Successes of Soviet Electrophotography; A Scientific and Technical Conference on Questions of Electrophotography

K.M. Vinogradov described some of the features of the cascade and liquid methods of electrophotographic development. Yu. N. Karpenko derived his report to the criterion of light sensitivity of the electrophotographic process. After the reports, a discussion took place on methods of determining the light sensitivity of electrophotographic lasers. I. N. Chernyshov spoke on the prospects of developing polymeric processes using electric and magnetic forces. O.Y. Grover (speaking also for I.I. Zhilovich, I.V. Slobodchikov, V.A. Pashchenko and V.I. Olsuf'yev) reported on the development of electrophotographic reproducing equipment. A.G. Pashchenko (speaking also for V.V. Zvezdinich, A.S. Borodin, V.I. Gal'vitskii and M.I. Rauzavskas) reported on the use of electrographic methods in recording oscillographs and other recording instruments.

V.P. Iushchenko (speaking also for N. G. Salin) spoke on the possibility of electrophotographically recording images from electron-beam tubes. L.S. Korol' (speaking also for N.M. Ushkevich, T.I. Kozlova, B.I. and B.I. Kalinavskaya, I.F. Kryzhev, T.N. Slobodchikova and B.I. Novikov) gave a detailed description of laboratory machine methods of producing photoconductive Paper (zinc oxide) (speaking also for I. Zhilovich, O.I. Grover, V.V. Gordov, N.V. Slobodchikov and V.V. Gel') described a laboratory and industrial machine for producing photoconductor papers. T.N. Zhishina (speaking also for I. Zhilovich) reported on a method of examining electrophotographic materials using an a/c bridge. S.I. Khotimovich (speaking also for A.I. Gikens and I.S. Khotimovich) spoke on developing materials for electrophotography and ferromagneticotography, including developers giving a reverse image. B.I. Nizhnyov reviewed methods of measuring the electrostatic potentials of electrophotographic layers, stressing that the oscillating electrode should not be placed above a layer with varying potential as this causes self-discharge. E. Erikovskis (speaking also for R.J. Gorovits, V. G. Goryainov and Ye. S. Charyton) spoke on the production of photoconducting paper. He said an electrostatic field is used to deposit a sample produced by the Grigla factory. Ye. S. Charyton also gave a historical review of the development of electrographic methods in which he paid tribute to the work of the Scientific Research Institute of Electrophotography in Leningrad and the Institute Poligraficheskogo Mashinostroyeniya (Institute Polygraphic Machine-Building Institute (Mascom)). Lectures were then held

Card 6/10

on methods of measuring the potentials of charged electron photographic layers, the vibration pick-up method was shown in B.I. Tikhonov's report to be not always accurate. S.G. Grishin stated that the bad influence of the oscillating electrode can be eliminated if the electrode probe above its surface is fixed and the pick-up is connected to it by a shielded cable. In the debate on Ye.I. Neimark's report it was stated that the research of Academicians I.V. Terenin and V.E. Potapko should be continued on the basis of all work done, since the possibility of optical sensitivity of the internal photocell in no. 212012 is questionable. A.I. Klimashev gave a report on the depositing of charges by a corona discharge. A.I. Klimashev and A.P. Isayev reviewed some of the results of the use of electrographic methods in radiography. L.I. Brun'ko (speaking also for I.U. Zhalevich, I.Z. Plavina, Yu. K. Vlachkov and Yu.A. Zubova) reported on polarization processes in semiconducting layers on polarization electrodes. Yu.K. Vlachkov gave a report on research on electronic properties of the polycrystalline layer of pentium selenide. Yu.V. Mihailov spoke on some of the photoelectric properties of Ge2S₃ and S₂S₃; the absorption maximum of the latter is about 900 Å. G.M. Dergunov reported on methods of obtaining selenium light-sensitive layers, including sublimation and thermal treatment; it was also found that the sensitivity of the layers increased after storage for 1.5 to 2 months at room temperature. P.M. Podolskii (speaking also for S.G. Grishin) spoke on research into the electrical properties of electrophotoelectric layers of amorphous selenium and powdered zinc oxide. N.K. Spiktorov (speaking also for J.A. Tsvetkov) discussed the production of tellurium layers and some of their properties. Finally the following reports on ferromagnetography were delivered: 1) A.Ya. Katschikov, V. Zhogol'shchikov - "Electrodeposition of Hard Ferromagnetic Alloys"; 2) M. Frantsuzov, "Visualisation of Magnetic Oscillations by the Ferromagnetic Method"; 3) V.-F. Fal'mov, "Ferromagnetic Recording of Facial Images"; 4) I.I. Zhitovich, I.F. Glik, B. Ye. Suchkov, I.I. Rytov, A.F. Shilov, "Rock Experiments in Non-Pressure Ferromagnetic Crystallization". There was also an exhibition showing the work of the Electrotechnical Institute. The most important conclusion of the conference was that a solid approach had been made to the possibility of wide technical use of the methods of electrography. It was considered that although work in this field actually started only in 1955-6 it has covered as much ground in the USA in 10 years. While admitting that it is easier to reproduce results already achieved than to be the first to arrive at them, the Conference observed that the Americans took good care that no important information appeared in the literature available.

TITLE: Compiling routine for an electronic digital computer using input language ALGOL

SOURCE: Leningrad. Universitet. Kafedra vy*chislitel'noy matematiki i vy*chislitel'ny*y tsentr. Vy*chislitel'naya tekhnika i voprosy* programmirovaniya, no. 2, 1963, 105-115

TOPIC TAGS: digital computer, digital computer compiler, ALGOL computer language, computer language, complex algorithm, computer programming, machine language, binary code computer, computer input language, ALGOL

ABSTRACT: The input language and the algorithm of the programming

Card 1/2

ACCESSION NR: AT4008632

program developed in the Computation Center of Leningradskiy Universitet (Leningrad University), which is an abbreviated and modified variant of ALGOL-60, is described. The language differs from ALGOL in that the program as a whole constitutes one block and there are no descriptions of types; a separate class of identifiers is used for each class. The operators (particularly the procedure operators) and the description of the procedures are simplified and standardized. The input language itself and the operating principles of the programming program are described in detail and the algorithm for solving a system of linear algebraic equations of 50th order by the Gauss method, with choice of the principal element, is used as an example. Orig. art. has: 28 formulas.
